

Fujitsu W-Wallet Solution

The Fujitsu W-Wallet Solution delivers a variety of new secure services to mobile phones.

Transactions in wireless environments introduce new security risks versus wired ones. The Fujitsu W-Wallet solution uses a novel security protocol geared for wireless while emphasizing user convenience. The user only needs to type a 4-digit PIN into the mobile application at the time of the transaction.

The phone does not store the PIN, personal and account info, so that if it is lost or stolen, it can not be used for transactions.

The Fujitsu W-Wallet application is a J2ME or BREW downloadable application that runs on virtually all current mobile phones. Easy user sign-up done at your web site.
